Four alternative ways to wear the surcoat sleeves.

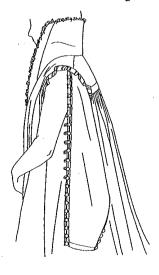

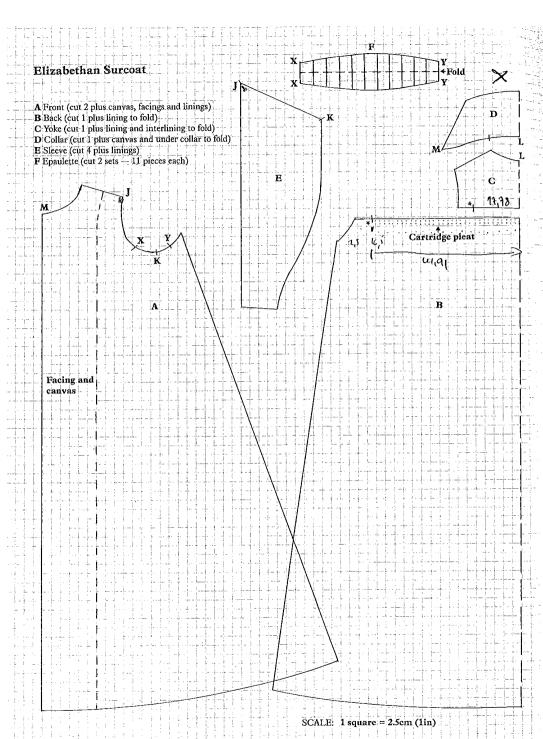

This type of garment is usually faced with fur. In the theatre — both amateur and professional — an old fur coat is often presented to the maker for this purpose. Fake fur can also be used and treated in the same way. I am not in any way a furrier but have been faced with this problem on more than one occasion.

Choose the best pieces of the fur for the parts which are going to be prominent. You may have to

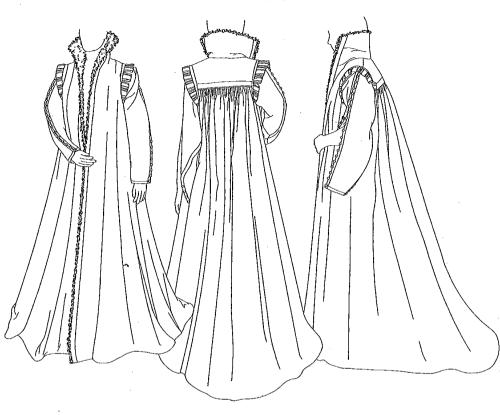

cut pieces from various parts of the skin or coat to get strips that are long enough for floor length garments. Always cut from the wrong side with either a fur knife or by sliding the scissors through the skin, or, using very short cuts, slide the lower blade of the scissors along the skin between the pile of the fur. The fur itself must not be cut. Join the pieces by either whipping the edges together by hand or zig-zagging.

SURCOATS

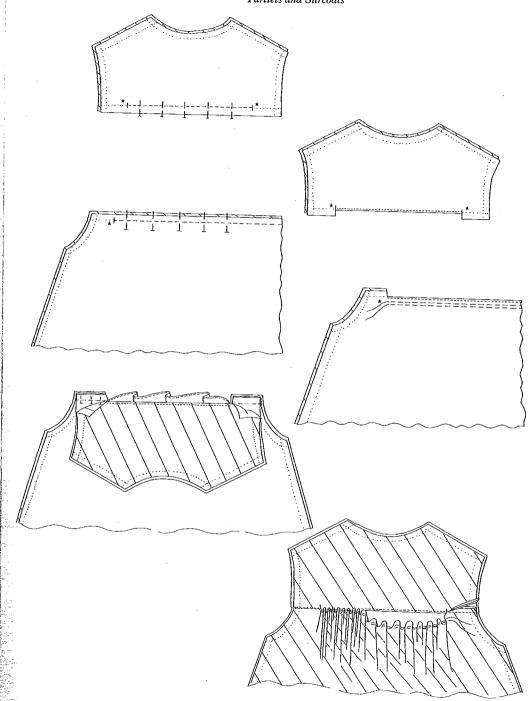

The surcoat is another very flexible garment which Making up can be worn indoors or out.

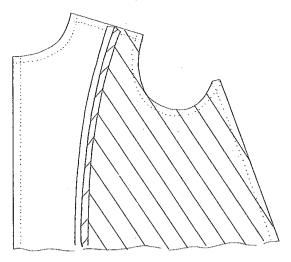

My pattern is an adaptation of an original which I developed while making Elizabeth R. The back can be either cartridge or flat pleated onto a yoke which comes just below the shoulder blades. This makes it hang and move well on stage.

It can be made in any sort of fabric from silk to heavy wool. When using heavy fabric it is very easy 4. Bag out the back from * to *, press and edge to get a humped back look, but with fine fabric it is not a problem.

Designers are apt to choose thick fabric for this type of garment, or want to line them with man made fur which is also thick.

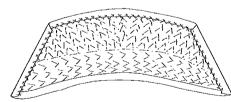

- 1. Cut all pattern pieces in both fabric and lining and any interlining that you feel is necessary.
- 2. Bag out across the bottom edge of the back yoke from * to *, press and edge stitch.
- 3. Stitch any wheel pieces necessary onto both lining and fabric of the body of the garment.
- stitch, and put in threads for cartridge pleating. These must be as shallow as possible, although the thickness of the fabric will dictate this.
- 5. Join the yoke fabric to the back from * to the armhole edge as an ordinary seam, pressing the seam allowance upwards. Finish by felling the yoke lining over the seam. Cartridge pleat the remaining back and stitch to the yoke.

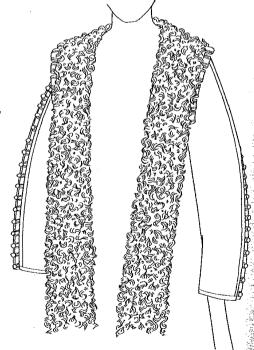

Put the fabric and the lining together and treat the back as one. Flat pleat by putting the pleating onto the top fabric of the yoke and then felling the yoke lining over the join.

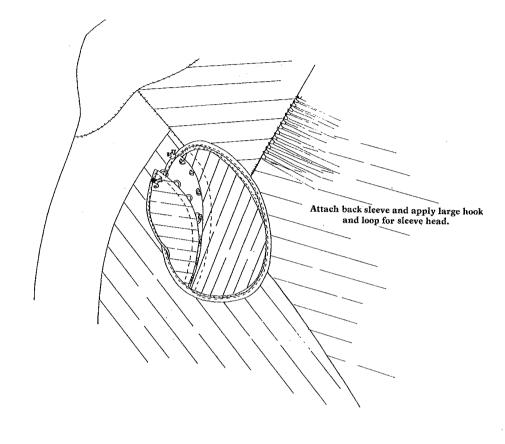

- 6. Put on any decoration needed across the back.
- 7. Join the front to the back at the shoulder and side seams.
- 8. Prepare the under collar. This may have to be interlined, which can be done either in the traditional way by pad stitching canvas, or by ironing on stayflex or vilene. Turn in the allowance over the interlining, herringbone down and press the edge.

The front of the coat may also need interlining.

- 9. Put the under collar onto the neck edge.
- 10. Apply the top collar by felling the under collar onto it, or bag it out.
- 11. Put the facings onto the linings and from now on treat them as one unit. (Any good commercial coat pattern will explain the technique of putting in the lining and facings as one.)

Alternatively put the facings onto the fronts of the garment, and then fell in the lining in the usual way. The facings will need to be wide enough to cover the lining sufficiently when the fronts are turned back, if the coat is to be worn this way.

- 12. Press the front edge and decorate the join if required.
- 13. Join the side seams of the lining.
- 14. Fell the back yoke lining across the shoulder seams and the back neck.
- 15. Decorate the hem line if required.
- 16. Turn up the hem with a herringbone stitch, and then fell down the lining.
- 17. Bind over the armhole edge.

SLEEVES

- 18. Decorate the sleeve fabric if required and make up back seam.
- 19. Make up lining, and bag out down the fronts and across the cuff end. Bind over the head of the sleeve.
- 20. Whip into the back armhole from Y Z and put a large hook onto the sleeve and a loop onto the sleeve head.
- 21. Make up the tassets as required by the design and put them onto cover the sleeve seam.

 This sleeve can be worn in many ways, as can the collar.

c1615-20 Museo Parmigianino, Reggio Emilia 23A. A suit consisting of doublet and trunk hose. The early provenance is not known. The satin ground, of a colour between light crimson and geranium, has an applied layer of soft, creamy leather with a suede finish, cut in a trellis design with carnations, or gillyflowers, in the spaces. The design is similar to that of the doublet in Richard Sackville, 3rd Earl of Dorset's portrait (Fig. 200). Presumably the pattern shapes of the suit were drawn out on the leather, then the trellis shapes lightly scored on each one and the design of carnations traced out. The pieces of leather would then have been placed on top of the satin, stretched taut in an embroidery frame, giving generous turnings to allow for the amount which would be

EMPL. OFILETY + MOLILLETTE

taken up with the stitching, or quilting as Alcega described it in 1589. Every shape was then outlined with small, even back stitches in pale pink silk, now faded. Large areas were then skilfully cut away to reveal the satin below.

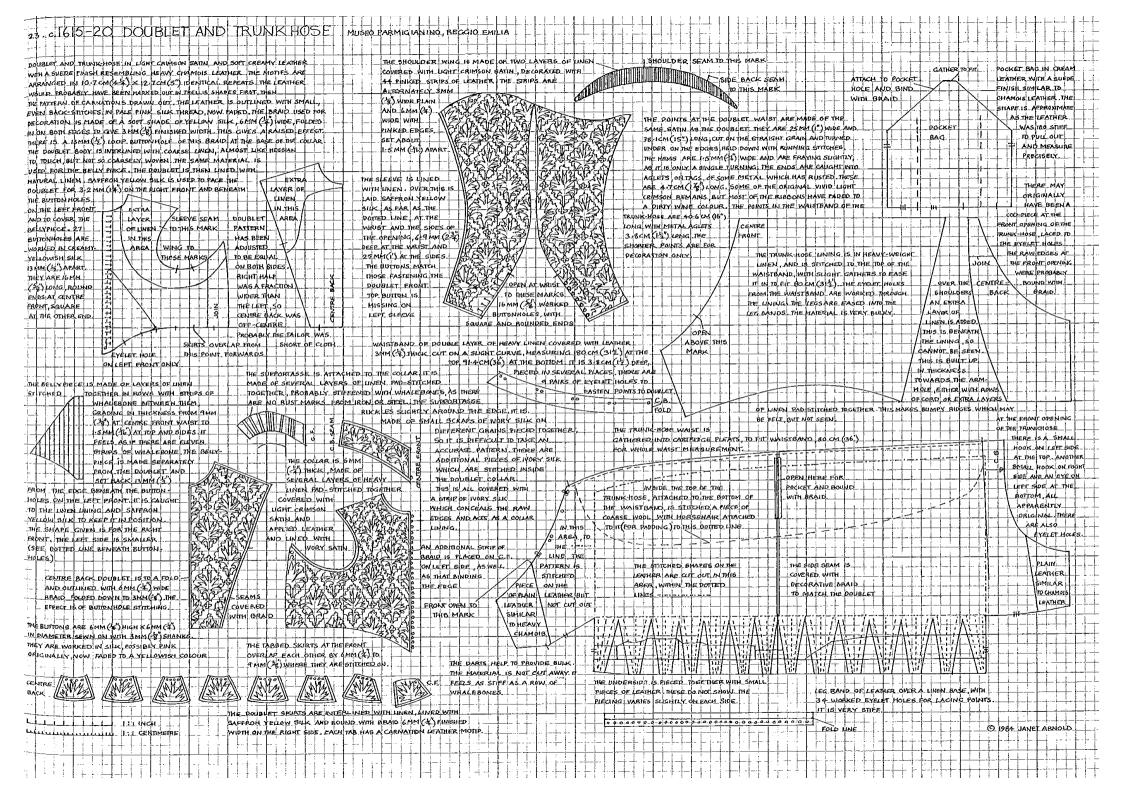

23B. The doublet has a supportasse, or underpropper, attached to the collar. It is made of several layers of linen pad-stitched together, probably stiffened with whalebones as there are no rust marks from an iron or steel framework. Small scraps of ivory silk are pieced together, disregarding the grain of the material, to cover the linen. Additional pieces of ivory silk are also stitched inside the doublet collar. This is all covered with a

strip of ivory silk which hides the raw edges and acts as a collar lining. A standing band of linen bordered with lace, or entirely of lace, stiffly starched, would have been worn with this doublet. The front is stiffened with a belly-piece made of layers of coarse linen with rows of stitching in linen thread holding strips of whalebone between them. The left side of the belly-piece is made slightly smaller than the right. It is set back under the buttonholes so that when the buttons are fastened the edges of the belly-piece butt together in the centre front and lie flat to give a smooth line. Eyelet holes are worked in the tabs forming the skirts of the doublet. Some are to take the long points supporting the breeches, others for short

decorative points, some of which are still in position. From 1560 to about 1610 points were hidden beneath the doublet skirts, fastened through eyelet holes worked in a band at the waist. This fashion for having the points tied through the doublet skirts and seen in the first decade of the seventeenth century became more widespread in the second decade. Extra points were tied on for decoration and gradually heavy metal hooks and eyes replaced the functional points during the 1620s. The decorative points remained round the waist of the doublet until the 1630s.

c1615-20 Hessisches Landesmuseum, Darmstadt

18. A doublet in deep reddish-plum-coloured satin decorated with narrow stone-coloured silk braid and rows of pinking. Its early provenance is not known. The slightly pointed front, the area of wool padstitched over the shoulders, the waist level and two-piece sleeve may be compared with Sir Richard (?) Cotton's suit, which can be precisely dated to 1618 by his portrait (Fig. 190). The doublet is interlined with black linen, now faded to dark brown. A layer of black corded silk was originally placed over this, beneath the satin, but most of this has now disintegrated, except on the skirts where it remains in good condition. This would have shown through the pinking holes. The pinking may have been done after the layers were tacked together as some of the black linen and black silk are cut as

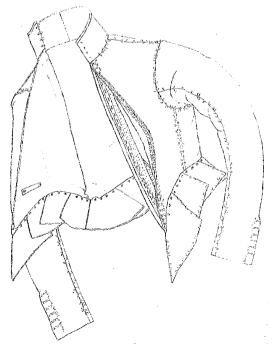

well. A layer of black wool is pad-stitched to the linen over the shoulders to prevent wrinkles around the armholes. It is layered to prevent any ridges showing through the satin. The doublet is lined with natural linen, the side seams set back from those in the satin, presumably to avoid bulk. A stiffened linen strip with worked eyelet holes for points to attach the breeches is stitched inside the waist. The belly-piece is made of four layers of black linen and one of thick, lovat-green felted woollen cloth, all pad-stitched together, tapering out gradually so that no ridges can be seen. A strip of braid, folded in half to make a loop, is stitched on the belly-piece on both fronts, to be tied across, holding both sides together before buttoning the doublet.

c1615–20 Lord Middleton Collection, Museum of Costume and Textiles, Nottingham

19A. A doublet in ivory silk with thin silver strip in the weft and a woven pattern of stylized floral motifs in heavier metal thread of gold strip wrapped round a silk core and pink, blue, greeny-brown and turquoise silk. The doublet has apparently been in Baron Middleton's family since the seventeenth century. It is similar to many doublets in portraits dating from c1615-20 (Figs. 179 and 200). The doublet is completely interlined with heavy linen canvas, with a narrow strip of linen pad-stitched down both fronts for extra stiffness beneath buttons and buttonholes. Over the shoulders, under the arms and across the back is a layer of brown woollen cloth, slightly felted, which is pad-stitched to the linen interlining. The doublet is lined with pink silk. This drawing shows the conjectured appearance of the doublet in its original condition.

19B. Although some early doublets were made without sleeve wings, this doublet appears to have had them removed at some time and the left sleeve reset with the seam lower than the right at the back. All the buttons have been removed and tufts of yellow silk indicate the original position of lines of gold braid. On the right side of the collar are four long tufts of thread, the remains of button shanks. On the left side are four punched holes, about 19 mm $\binom{3''}{4}$ in from the edge, for loop buttonholes, now missing. These would have been made of plaited cord or narrow braid pushed through the holes and stitched firmly at the back. Eyelet holes for points to attach the breeches are worked in the tabs forming the skirts of the doublet, instead of a waist strip. The ribbon points would have been tied in decorative bows. This drawing shows the present appearance of the doublet.

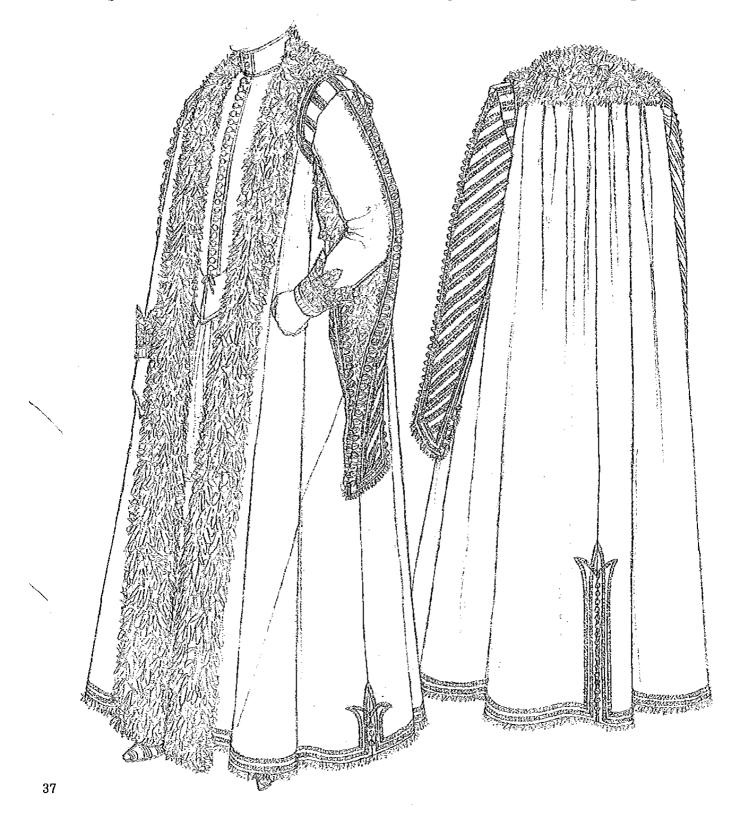

19B

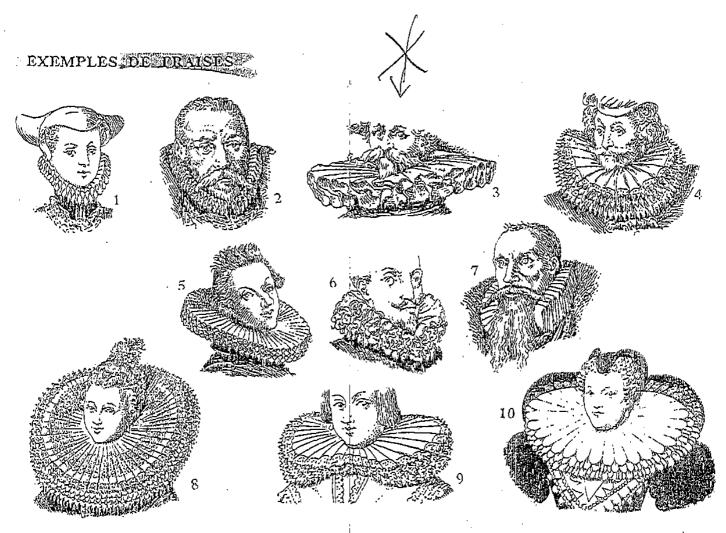

c1605-15 Sir Ralph Verney, Claydon House (The National Trust), near Aylesbury

37. A rich purple silk damask loose gown with hanging sleeves, lined with deep grey silk shag, now faded. By tradition this was worn, together with matching nightcap and slippers, by Sir Francis Verney who died in 1615 at Messina. J.L. Nevinson suggests that he may have left it behind him on his last visit to Claydon in 1608. The back is gathered up and stitched to the front shoulders and the collar, the raw edges being covered by a narrow green silk ribbon which also acts as a stay tape. Two more green silk ribbons are stitched to the

armholes across the back at shoulder-blade level, acting as stay tapes to hold the pleats in position. The hanging sleeves are fastened with buttons of silver and gold metal thread and purple silk worked over wooden bases with plaited loops of matching threads. They can be left unfastened for the arm in the doublet sleeve to pass through at elbow level. Alternatively part of the sleeve can hang free if a hook and eye are undone under the wing (Fig. 270). The arm then passes through this aperture as shown in the drawing. Sleeves, armholes, front edges, hem and pockets are all trimmed with gold braid.
